AMENDMENTS TO THE ABSTRACT:

Please amend the Abstract as follows:

ABSTRACT

The invention relates a A method, a system, a server, and a computer program product are provided for Multimedia Capability discovery of different user terminals 12,13. This solution avoid unnecessary use of the radio interface and is avoided based on a network storage 18, which is accessible without registration to find out about the calling as well as the called user's multimedia capabilities during a voice call. If there is a positive capability discovery result out of this for both users, the system will send sends a message to each of the two-user terminals 12,13-that they should notify the users, e.g., by displaying an icon above a soft button. There will be is no need for establishing a packet switched session, which uses a lot of radio interface signalling, until the Multimedia Service capability of both subscribers and their user terminals are is investigated and responded to both user terminals and their users.
